

P1

Answer 1

I guess it could be helpful to memorize what happened during the meeting through providing context. It's just images and no audio recording. So, it won't give all the details but it will just provide some context that you can glance back at. Although it might sort of random what is captured according to your position, if you are sitting down or standing up or imagine some whiteboard that would provide a context right? A good context to memorize what happened but it won't capture that unless you stand right front of it so, in a way I guess it could be useful but if you are in specific situation like whiteboard or something that could be difficult.

Answer 2

I think it's quite cool with the device. The physical device, it's nice to that turn it around. If you sit by a table, it's like it's a nice device to interact with.

Answer 3

I would like to use the device with these functionalities but if the phone application would have more functionality like seeing what peers are connected specifically or something like that with more information, that could be on the device perhaps that could be useful, but it's nice is to use the device.

Answer 4

No, I think the gestures are intuitive.

Answer 5

Yeah, for example with the peers I would like to see which peers and because it's not clear to me what distance they must be before they connect. If I could add to the pervious question the tapping to lock/unlock and then the shaking perhaps those two could be mixed up in a bit if you have it in your hand the tap could sort of also move the device sort of like a shake. Tapping on the device could shake it and then that's a bit ambiguous.

Answer 6

Yeah, I guess if you turn the device around and is visible on device that now it's turned upside down and it's not recording. Yeah, I guess that could influence their sharing decisions of others or if you turn it facing yourself it's clear to others that you are recording but you are not sharing the data. But with the app that's not visible you can't see what others are doing with the app unless you have more information in the app like the ability to see the peers and what the peers are doing if they are sharing or not.

Answer 7

Yeah, well you share only with those in close proximity but I guess if there is sensitive data what is shared and you don't lock the peers someone could come close by and the tap-off of the information. So, it depends on within which range that is. So, I wouldn't feel confident that about sharing sensitive data and I like to feel that was secured in this data I wouldn't get out again or shared with anyone else but the person I would share with group I shared with.

Answer 8

So, in a way yes in a way no. Because if you get an awareness there is some data captured that you don't want to share then you can delete 30 seconds back and I guess you can do that multiple times but if you are not aware of that before more time has passed then data the data is already shared. So, it's something you should be quite certain what you are doing, when you have a meeting in a way that's like having a meeting whatever you say it can be answered you have said it right so it works in parallel with that. But when you choose to share then you might be able to forget stop sharing or stop recording or both and then might share something you might not want to share. So, you should be conscious about that otherwise you might a mistake with that.

Answer 9

No, it doesn't because you can't see. Because you don't have something in front of you that provides status on, if whether its recording or sharing unless you should, on a normal smartphone device, you must enable the device to stay on all the time and it's tedious you should go into settings display settings and stuff to change the display timeout to always on unless you do that it would switch off and you won't know if its recording. Yeah you wouldn't have any indicator of that so the device it provides much better workflow when you use the MemStone as a tool in your meetings.

Answer 10

No

Answer 11

Yeah, this thing about the peer's I don't have any idea if it could be improved in some way but I think more information about the peers I guess you would need a bigger display to show that information but maybe to create a user profile or something on the device so that you type in our name and your device has a name and then you can see what other device names or what other people are connected as peers.

P2

Answer 1

I think it can be very useful especially in comparison in taking written notes, so that you will capture the mimics of the other person that is 80% of all the communication that goes on through mimics and how you move your hands(gestures) so I think it's good. I also think that recording sound can also be very useful especially if you're sitting in a meeting the important people if you are disagreeing, you have to come to some agreement, it would be really handy to have it as well.

Answer 2

It was really fun to use. I thought it was a bit easier to use than using the app, you don't have to unlock your phone and press the right button so it was quite intuitive and user friendly and I think even children would be able to use this correctly and be able to Learn it in few mins. I like it.

Answer 3

I think, I would like to use to MemStone preferably because before like I said the phone app was more tedious that you have to unlock it and find the right app and so forth. It was really too easy to use it as well but MemStone is quite easy.

Answer 4

No, it was easy as well tap to lock shake to erase and the way it was facing, I thought it was really intuitive, user friendly.

Answer 5

I think even though it's a small screen, yeah, it was like a Tamagotchi size but I think it provided all the information. Maybe, I didn't see the other peer who was also interacting in the meeting. I am Thinking the third person suddenly comes in it should also show his name so that you will know who it is. Probably it does that I didn't notice it that's all I think.

Answer 6

Yes, I think because people are very sensitive to other mean and what other people do and we usually follow. I think if one erases then everyone will start to erasing as well.

Answer 7

If it's encrypted yeah, why not I have confidence in it.

Answer 8

Yeah, it depends on my ability to remember to lock it and of course I can sometimes forget. I don't think it's about technology, it's about human error. Of course, you should be a little bit careful or thoughtful of it.

Answer 9

Yeah, I think so.

Answer 10

I think it's a great technology, very user friendly, well developed. Yeah of course, it's a demo so the last one when you tap it won't make such a loud noise so everyone in the meeting won't be disturbed. And I like the vibration it becomes like pet in a way I guess you can become more emotionally bonded to it. Yeah, I hope that I would see it on the market in the future I would probably buy one.

Answer 11

Maybe, make it a bit lighter so that it fixes in a shirt pocket, something like that but otherwise no. And should be able to tag your name on it because you can easily swap them in a meeting if everyone has it.

P3

Answer 1

I am not very convinced about sharing images would make effective communication for a meeting, at least to the way I use this device I don't find it very convincing as such.

Answer 2

The device seems a little too difficult to use in a sense there a few functions which was not very responsive apart from that I think it's simple tool if that could be fixed, it's a simple nice tool.

Answer 3

I think the phone app is better personally, I don't like to carry too many electronic devices around and just trying to have one electronic device makes it better than having too many tools. Therefore, I think personally having the phone App would be better than having the MemStone device.

Answer 4

Yes, the one where you lock by tapping the device that seemed almost impossible to do not sure if it's hardware issue because it's a test hardware but yeah, I don't know.

Answer 5

So, far I think it gave enough feedback but of course since I can't have an active preview of the data of its recording I would prefer that it could be a part of it.

Answer 6

It depends on the other person used to using this device. If we are a group of people and if the other person is kind of used to using this device, I think it won't be a problem. If I have someone new audience who never seen using this device maybe I might be disturbing. But I don't think so because the gestures are quite subtle so I don't think it will influence much in the people's ability to focus on the meeting.

Answer 7

I think so I don't know about the security feature of the devices.

Answer 8

I would like to know about the hardware encryption which is being used in this device before I would be able to answer the question.

Answer 9

I think in general, I could use third party security software's to control the data transfer between apps. Between interlinked apps or apps which are sharing data but I don't know about the internal security of this app.

Answer 10

No, nothing in particular.

Answer 11

Of course, the display of the captured information would be nice and also, in the phone app the display of what's been captured that I think that will be all a nice feature to have.

P4**Answer 1**

I think it depends on who you're with, if you are on your own you can just do it whenever you like but if you are with anyone else I think you should explicitly ask for consents when you turn it on or before you turn it on. I wouldn't use it public, I think I would only use it in private conversation with someone that I can ask consents.

Answer 2

Well it does seem like a prototype but I like how it is visible compared to the app you can easily see whether its recording or not, but I think its little bit more complex to use. I think the gestures should work completely perfect every time otherwise you can accidentally record something that you are not supposed. I think integrating with the camera itself would make a lot of sense maybe the camera itself could have some similarities to show whether its recording or not and whether its sharing and so on. So that you won't have an external device like this.

Answer 3

I probably prefer to use the phone app just because you are more confident that it works. Yeah, it's kind of more fun to use, it is little less boring but you also worry whether its working correctly and also, I think it's one more thing to carry around in your pocket which is kind of annoying. We already carrying our phones and keys everywhere so yeah, I think I prefer the phone app or the device integrated into the camera.

Answer 4

The tapping a little bit awkward and the shaking you don't really know, I mean you kind of see whether it works but when you shake it's hard to see whether its erased or not. I think it vibrates when you erase something so that helps you at least but it's hard to see the screen when you are shaking and I think it should be more obvious once you tap it as well whether it's done anything.

Answer 5

I think it should have extra LED for locking. And then just keep the number of peers and the recording time 'ON' at all times, and then remove all the extra stuffs just so it's completely clear. The extra stuff that's not the time are the number of Peers is just sort of visual noise, I think and you don't really know what to think about it so just having LED and number of peers and recording time would be perfect I think.

Answer 6

I guess it's more obvious than if you use the phone app. Because you can't really see what anyone doing on the phone I was also trying to sort of show the phone for the camera because it's kind of hard to tell but someone's doing. So, I think if you go like if you turn it

upside down or whatever it's kind of also tells everyone else in the room that I want to be private and that you want them to stop recording as well.

Answer 7

I don't know it's kind of a black box. I think just saying the number of peers under the device kind of doesn't tell you really who you are sharing with. Because you could have accidentally connected to someone else and if you lock it you think you are sharing with the person you are talking to but it can be someone completely else. So, if you have the phone app it could also display the name of the person you are sharing with. And also, the fact is that it's just sort of record on to the device and then maybe I think you said it would uploaded to website. I think, I'd be more confident with it if it didn't connect to any outside websites or anything and maybe just had an SD card or if you use the phone app it just records directly to your phone. So, sort of know what it's doing, know it's Sharing.

Answer 8

Well, it's more Public whether you're sharing data are not but you don't really have full confidence whether it's working whether its recognising the gestures and if I just sort of stores it on a SD card that is encrypted maybe then one can take out the SD card and read it over and upload it to a website you don't really know who's controlling that website. So, yeah It would have to sort of making more confident that works at all times that it stores information secure and privately.

Answer 9

Sure, from my own perspective I think from your own camera it does if anything makes you slightly more aware that is working or not because you can see that the button worked you don't really know whether the gestures work or not. But so far from the other person's perspective them to one you are meeting with I think the device sort of feels more private because you can actually see what it's doing.

Answer 10

I think the primary thing I would integrated the device to the camera itself so maybe you have some LED's that show whether its turn on whether its sharing whether its recording all that stuff and then recorded you then into an SD card on the camera itself or onto your phone and then also being able to tell which peers are Connected to. I think really important just to make sure is it you actually connected to the right person. And I'm sure if there's anything else it feels, I mean the camera looks really nice and small but I think I'd better well I have a slightly bigger camera and then not have to carry this thing around.

P5

Answer 1

It easily gets confusing, too much video is a bad thing. Still images are okay because you get information overlook.

Answer 2

The MemStone device is okay, the phone App is different. MemStone device can become very intuitive and you don't have to think about it the other one you have fight the phone first to get access to the app.

Answer 3

The MemStone. (for future)

Answer 4

Yes, I never found out what double tapping meant nor locking. Also during the interview, I think he asked to have it locked and then he never told us to unlock it and then he told us to lock it again.

Answer 5

It displayed more information than I understood. So basically, if everything else fails with the directions with use and I haven't seen any. But I think a lot of information can be put on the MemStone itself so it becomes self-explanatory because people don't want to read manuals.

Answer 6

Depends on the other persons.

Answer 7

You have to trust the people developing it basically I would assume but I would never take anything for granted.

Answer 8

Yes, If the MemStone works as advertised and if all the data links are okay and if you know the handshaking is okay to make sure that I won't continue to record once the data link is broken down there has to be some controls in the system that will take over that things won't work as advertised which quite often don't do with wireless data links.

Answer 9

I don't know I assume it does if it works on the same Bluetooth link and if that Bluetooth link is encrypted.

Answer 10

No, I think it's a good first start but it has to be made more self-explanatory basically. And maybe the idea of locking should use another expression. Because locking and unlocking is sort of broader than what you actually intended to do.

Answer 11

Yeah, a bigger display plus context sensitive help but I understand with this type of display it's very hard to implement but with the App which I don't like, will be easier to implement but I think it would be better to have it on the MemStone.

P6

Answer 1

So, I'm little bit confused whether it actually works. I would say I can see the effect of the video of having like recordings with the video but with images I would still forget a lot of stuff. But I would not feel confident I would still feel like I would have to take notes on either paper or computer as I do right now so I would feel a lot more confident with videos and not just images.

Answer 2

Well I like the device. I like the design of it and I mean it's kind of like a toy the device I liked.

Answer 3

So, I think if I were to buy it right? I would probably go to the phone app because even though the device is more fun to use, it takes more effort in a way you to remember to bring it and I guess you need to charge it as well. Yeah, if I were to use in the future I would go to the phone app even though its less fun.

Answer 4

No, not at all.

Answer 5

It was perfectly fine I mean the whole tapping didn't really worked but as you said it's just a prototype so that's cool otherwise, it's all good.

Answer 6

Maybe, I guess but I think probably at the beginning people will noticing it but after a few meetings you know it will get integrated into. So, I don't think anyone would notice it anymore.

Answer 7

Maybe, I don't yeah, I guess so.

Answer 8

I would say yes, I would totally be comfortable with sharing it. Because yeah, if it just pictures.

Answer 9

I would say yes again I'm not that secure freak.

Answer 10

(Concerned about how images will recall) Yes, has there done any research about when people see images that actually provokes memories brings back the memories back from the meeting? "I think yes". "Wasn't so sure about image capturing to provoke recall".

Answer 11

No, I like it. The App is a prototype it's like very boring right now. So, I would make it a bit more funky and also, I don't know make it more as a game because the reason why device is more fun to use because it's like a little toy. Yeah, it's like playing a game in a way I mean in the beginning of course then you get used to it and probably you don't really care but the phone app it could be more fun.

P7**Answer 1**

I think that's good it keeps the track off all the things we do and from my experience, if I write from a notepad or word I kind of lose track of what's happening. So, I think this keeps track of everything what we do at least through images especially when you're doing presentation we note down something on the board and I think that's really useful for us.

Answer 2

It was easy to use but I think the sensitivity was a little less. So, for instance when I had to lock I had to make sure it was locked or double tap it again and to delete it I had to shake it more than what is required so it was good but I think a little less efficient.

Answer 3

I would like to use the phone app because it was more user friendly and phone is something that we have with us all the time so and the app is really easy to use.

Answer 4

Not really, they were like 5 gestures and everything was easy to learn and use but I had to make sure that I have done it right so I had to just keep beeping on the screen to see if it is activated or not.

Answer 5

Yes, it did give me what is needed in the future I think I'll make it later more easier to use for instance instead of double tap probably I would do something like a touch sensor or some kind of movement other kind of moment. But otherwise I think this is all which we need for a meeting to stop recordings to stop sharing or for a personal recording things like that.

Answer 6

They might be curious to see what I'm doing for some instance if they can easily know whether I'm sharing or not so they might be a little offended. If I don't share with them but if I'm the boss it's fine but if I'm still the lower side employer or something then the boss wouldn't feel good about it so I think that could cause a problem.

Answer 7

Yes, I guess that MemStone helps in such sharing.

Answer 8

Yes, I am able to control but the only thing was because it's less sensitive I have to probably it take five seconds extra or 10 seconds extra to make sure that the privacy is just between

me and my colleagues and not with anybody else but otherwise I think it's secure to be used.

Answer 9

It's the same level but I think it's it saves a few seconds of your time because it user friendly and you the button directly on screen.

Answer 10

Like I said out of the 5 gestures in MemStone, to delete and lock it I think probably some easier gesture could be used probably to make it simpler probably a button because that is quicker.

P8

Answer 1

Okay so, it's relatively easy compared to taking down and then like screening it later like you have the auditor initially and then you can pick out whatever you want so I feel it easier.

Answer 2

It's tiny and it's easy to use but probably it need more advancement or a better interface than it has now.

Answer 3

Actually, both were easier. Comparatively the Phone App was better. But the problem is screen locking very frequently you wouldn't know whether it's been recording or not in the long term so that was the down side but I would say the app was way easier than the MemStone.

Answer 4

No not really.

Answer 5

It gave what was required. So additionally, I would like to know whether it actually sends the signals or not.

Answer 6

Not really but it might be a little disturbance to other people so if everyone in the room or everyone in the meeting is using it I don't think it's an issue. If I am the only person who is using it might be like it will abruptly stop the flow of the meeting that's what I feel.

Answer 7

Okay so, I think the lock system worked when I used it but I am little bit apprehensible about its feature actually.

Answer 8

To an extent yes, but not completely satisfied. Because in a meeting a lot of confidential information can be shared and you wouldn't like completely to remember that you are actually recording it and sharing it so even a small change in gesture and without noticing its change you might share sensitive information.

Answer 9

I feel the same way with both the applications.

Answer 10 & 11

I think it works fine in the way it is I don't know what exactly you can change in this.

P9**Answer 1**

I think that's good but I couldn't really figure out how being like using it and extract information for it. Because it's image and in the meeting people are talking or writing so I thought more like some kind of linguistics messages should be more easy to the extracted. So, I personally couldn't imagine myself making the best use of the image honestly yeah.

Answer 2

I think it looks pretty cool and it was very easy to use. I'm not really good at using a lot of technologies but even if I could use it so I think it won't be so difficult to use for other people as well but I'm not so sure if it needs to be separate because if you have the function some kind of apps on your phone you don't really have to have the device just for this function so I personally and I think if I have that device and if I had the same function in the phone I think it's very convenient for me to have it. Simply because I don't like having two stuffs at the same time so it was good but I couldn't see it's there just for that function.

Answer 3

I definitely think the one, the app on the phone is very good and for the second question yes, I would like to use this one I just like that the app on the phone.

Answer 4

Not really everything was simple especially the app interface was very clear for every single task to do and also it gave me the interactive reactions so I knew that its now sharing it's not sharing now and it just locked and so on. So, it was very clear and very easy to use.

Answer 5

I think it's very difficult but I think if it has some the words they said are available I think it would be great it's simply because meeting is exchanged of information and opinion and so on. So, we need to extract information as like language so I think sharing or recording the image itself might help to remember recalling stuffs and so on but it's not necessarily directly help me to remember or recalling or store information.

Answer 6

It might yes, I think and also it might be little bit awkward for example if you do double tap and you locked out and then if other people knew what this device is all about I think the people might know that the person just locked other people out or so and so on. I'm not sure if its other people's decision but I think it would affect other people's feelings and maybe eventually the decision as well.

Answer 7

It really depends on the how secure the device or app is. And I'm not really expert about this field. I'm not really sure. Sorry I can't really help but I think if there is information there available it's always there will be risks.

Answer 8

Basically yes, I think you have the option for it you can lock all the people or you can delete 30 seconds so if you are fully aware of the functions how it works it won't be a big problem but yeah that would be always a little bit of risk of exposing the sensitive data and so on but if you are fully aware and if you paid careful attention on it there will be no problem in my opinion.

Answer 9

Yes, I think it's almost the same I think it's nearly almost the same. Security level I'm not use but for the privacy control level didn't have any problem.

Answer 10

I couldn't find a reason why there's a two separate device if you could add the function in a phone it's just really easy to use so that way you don't really have to carry two devices at the same time and basically all the phone these days have the camera and recording function so it won't be so difficult too. So, I was not so sure why like there's an idea of creating the device itself just only for the function.

Answer 11

Not so much for now no.

P10**Answer 1**

It's nice visually you can see. It's easy to understand you can share with your members like team members. Yeah, its quite useful for example if I'm sitting on the first row and you are sitting in the back and you cannot see it clearly and I can see it from the first row and share the pictures of the slides right in front of the slides. I would also suggest to modify this system to use not only among members who are attending meeting, but also with those who are sick and couldn't come and you would share the information, pics and etc. with them.

Answer 2

It's very nice if people don't understand how to use it you can shake you can turn it on the orange side so people they do not understand anything its good among your team members and for those who are outsiders they will not understand it. But the disadvantage of this you have to memorise for example if you shake it the information will be deleted or you turn it this side or that side it takes time to memorise.

Answer 3

Let's say the phone app I like it because it's very easy to use but I would use maybe both of them in the future. One for those who don't understand how to use it, it's nice that only and your team member will understand how to use it and for phone app is good because you don't have to memorise the gestures you just need to press the button and that's it.

Answer 4

From the very beginning I was confused I made a mistake I just turned in the vertical side to share with everyone and record but it was just to record for yourself and then I realised it was a mistake and I turned it on the table so that I could share with everyone and record in the same time. No, it wasn't difficult I just need time to get used to get used to it.

Answer 5

Yes, for example you can delete the information which you don't want to share I don't know maybe for example to make it more colourful I don't know it's just like a pager to make it more interesting. I don't know if it's some pictures it is plain. Maybe like a calendar to see which date is today like time and date.

Answer 6

It depends if they understand my gestures or they don't understand. If they understand sometimes maybe yeah, I would influence for example if I put it on the orange side they would think she's not sharing the information she doesn't want it.

Answer 7

Yes, but you should be careful with your gestures if you made mistake and you turned in that or this side by mistake you should be very careful and by accident you can share some confidential information.

Answer 8

Yeah as I told you before you should be very focused on the device on your gestures to stay focused that you are not doing extra gestures or some actions and making by mistake by accident sharing the private information.

Answer 9

Yes, from the phone app there is no shaking there's nothing but button but sometimes also you should be careful like pressing too much sometimes you can also share by accident with phone app is much easier to control than the device.

Answer 10

So, you can also add some reminder for example during the meeting like group reminder is something additional.

Answer 11

I don't know it wasn't working while before like when I wanted to lock it didn't work you should maybe work on it that it will work like better.
